

Signed Macros and Excel

Macros in an Excel workbook can be digitally "signed". This process identifies the publisher of the macros and assures you that the code has not been altered since publication. All current versions of our [Option B workbooks](#) include a digital signature from Cornell University.

If the digital signature has expired, you are probably using an old version of the [Option B](#) application. With an expired digital signature, you cannot choose to **Trust** the publisher. You will have to set the **Medium** security setting, which is a less secure setting, for [Option B](#) to function correctly.

We recommend that you [update to the current version](#).
